Intel® Management Engine Firmware 12.0

Corporate Firmware Bring Up Guide

September 2018

Revision 1.6

Intel Confidential

By using this document, in addition to any agreements you have with Intel, you accept the terms set forth below. You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH Intel® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER, AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice.

The Cannon Lake Platform and Cannon Lake PCH products may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel® AMT should be used by a knowledgeable IT administrator and requires enabled systems, software, activation, and connection to a corporate network. Intel AMT functionality on mobile systems may be limited in some situations. Your results will depend on your specific implementation. Learn more by visiting [Intel® Active Management Technology](#).

Intel® Small Business Technology (Intel® SBT) requires an Intel® Small Business Technology enabled system and proper configuration. Availability of features will depend upon the setup and configuration by your PC manufacturer. Consult your system manufacturer.

Intel® vPro™ Technology requires setup and activation by a knowledgeable IT administrator. Availability of features and results will depend upon the setup and configuration of your hardware, software and IT environment. Learn more at: <http://www.intel.com/technology/vpro>.

Any software source code reprinted in this document is furnished under a software license and may only be used or copied in accordance with the terms of that license.

64-bit computing on Intel architecture requires a computer system with a processor, chipset, BIOS, operating system, device drivers and applications enabled for Intel® 64 architecture. Processors will not operate (including 32-bit operation) without an Intel® 64 architecture-enabled BIOS. Performance will vary depending on your hardware and software configurations. Consult with your system vendor for more information.

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. See http://www.intel.com/products/processor_number for details. I2C is a two-wire communications bus/protocol developed by Philips. SMBus is a subset of the I2C bus/protocol and was developed by Intel. Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

Microsoft*, Windows* and the Windows* logo are trademarks or registered trademarks of Microsoft Corporation in the United States and/or other countries.

Intel, Celeron, Pentium, Intel Xeon, Intel Core, Intel vPro™, and the Intel logo are trademarks of Intel Corporation in the United States and/or other countries. *Other names and brands may be claimed as the property of others.

KVM Remote Control (Keyboard, Video, Mouse) is only available with Intel® Core™ i5 vPro™ and Core™ i7 vPro™ processors with integrated graphics and Intel® Active Management technology activated. Discrete graphics are not supported.

§ §

1 Introduction

This document covers the Intel® Management Engine Firmware (Intel® ME) 12.0 - Corporate Firmware bring up procedure. Intel® ME is tied to essential platform functionality — this dependency cannot be avoided for engineering reasons.

The bring up procedure primarily involves building a Serial Peripheral Interface (SPI) Flash image that will contain:

- **[required]** Descriptor region — Contains sizing information for all other SPI Flash image regions, SPI settings (including Vendor Specific Configuration - or VSCC - tables, SPI device parameters), and region access permissions.
- **[required]** BIOS region — Contains firmware for the processor (or host) and/or Embedded Controller (EC).
- **[required]** Intel® ME FW region — Contains firmware for the Intel® Management Engine.
- **[optional]** GbE region — Contains firmware for Intel LAN solution.

For more details on SPI Flash layout, see the document **Cannon Lake-H / LP SPI Programming Guide** SPI Programming Guide and [Appendix A](#). Once the SPI Flash image is built, it will be programmed to the target based platform and the platform will be booted. This document also covers any tests and checks required to ensure that this boot process is successful and that Intel® ME Corporate FW is operating as expected.

CDI # 559465 Intel® Ethernet Connection i219 [Jacksonville]

1.2 Intel® ME FW Features

This firmware release includes the following applications:

- Platform Clocks – Tune clock silicon to the parameters of a specific board, configure clocks at run time, and power management clocks. **Benefit:** Allows extensive customizability and soft control of “Third generation” clock solution and makes clocks available before CPU powers up.
- Silicon Workaround Capability – Intel® ME FW will have limited capabilities to perform targeted workarounds for silicon issues. **Benefit:** Allows Intel® ME FW to address some issues that otherwise would require a new silicon stepping.

1.3 Prerequisites

Before this document is read and utilized, it is essential that the reader first review the Corporate FW Release Notes (included with this Intel® ME Corporate FW kit).

This document is constructed so that the reader can complete the bring up steps as given for the Intel Customer Reference Board (CRB). However, in the case that bring up is being performed on a different Intel® x based platform, this document will highlight any changes that must be imposed onto the bring up steps accordingly.

This document makes only the following limited assumptions regarding hardware:

- The platform is Cannon Lake S / H based
- The platform is equipped with one or more SPI Flash devices with a total capacity sufficient for storing all relevant firmware images.

1.4 Acronyms and Definitions

1.4.1 General

Acronym or Term	Definition
BIOS	Basic Input Output System
DIMM	Dual In-line Memory Module
DMI	Direct Media Interface
EC	Embedded Controller
FPF	Field Programmable Fuses
FW	Firmware
GbE	Gigabit Ethernet
HECI	Host Embedded Controller Interface (aka Intel® MEI)
Intel® ICCS	Intel® Integrated Clock Controller Service
Intel® ME	Intel® Management Engine (Intel® ME)
Intel® MEI	Intel® Management Engine Interface (Intel® MEI) (renamed from HECI)
Intel® PTT	Intel® Platform Trusted Technology (Intel® PPT)
Intel® MSS	Intel® Management and Security Status Application
KVM	Keyboard, Video, Mouse
LAN	Local Area Network
MCP	Multi-Chip Package (Central Processing Unit / Platform Controller Hub)
NVM	Non-Volatile Memory
OOB	Out-of-Band
OS	Operating System
PAVP	Protected Audio and Video Path
PCI	Peripheral Component Interconnect
PCIe*	Peripheral Component Interconnect Express
PHY	Physical Layer (Networking)
RTC	Real Time Clock
SBT	Intel® Small Business Technology
SMBus	System Management Bus
SPI Flash	Serial Peripheral Interface Flash
TPM	Trusted Platform Module
VSCC	Vendor Specific Configuration

1.4.2 Intel® Management Engine

Acronym or Term	Definition
3PDS	3rd Party Data Storage
Agent	Software that runs on a client PC with OS running
End User	The person who uses the computer (either Desktop or Mobile). In corporate, the user usually does not have administrator privileges. The end user may not be aware to the fact that the platform is managed by Intel® AMT.
Host or Host CPU	The processor that is running the operating system. This is different than the management processor running the Intel® Management Engine Firmware.
Host Service/Application	An application that is running on the host CPU
INF	An information file (.inf) used by Microsoft* operating systems that supports the Plug & Play feature. When installing a driver, this file provides the OS the necessary information about driver filenames, driver components, and supported hardware.
Intel® AMT Firmware	The Intel® AMT Firmware running on the embedded processor
Intel® Management Engine Interface (Intel® MEI)	Interface between the Management Engine and the Host system
Intel® MEI driver	Intel® ME host driver that runs on the host and interfaces between ISV Agents and the Intel® ME HW.
IT User	Information Technology User. Typically very technical and uses a management console to ensure functionality of multiple PCs on a network.
LMS	Local Management Service: A SW application which runs on the host machine and provide a secured communication between the ISV agent and the Intel® Management Engine Firmware.
Intel® ME	Intel® Management Engine: The embedded processor residing in the chipset MCP
Intel® MEBx	Intel® Management Engine BIOS Extensions
MECI	ME-VE Communication Interface
NVM	Non-Volatile Memory: A type of memory that will retain its contents even if power is removed. In the Intel® AMT current implementation, this is achieved using a FLASH memory device.
OOB Interface	Out Of Band interface: This is WSMAN interface over secure or non-secure TCP protocol.
OS not Functional	The Host OS is considered non-functional in Sx power state and any one of the following cases when system is in S0 power state: <ul style="list-style-type: none"> • OS is hung • After PCI reset • OS watch dog expires • OS is not present
System States	Operating System power states such as S0. See detailed definitions in System States and Power Management section.
Un-configured state	The state of the Intel® Management Engine Firmware when it leaves the OEM factory. At this stage the Intel® Management Engine Firmware is not functional and must be configured.

1.4.3 System States and Power Management

Acronym or Term	Definition
G3	A system state of Mechanical Off where all power is disconnected from the system. G3 power state does not necessarily indicate that RTC power is removed.
CM0	Intel® Management Engine firmware power state where all hardware power planes are activated. The host power state is S0.
CM3	Intel® Management Engine power state where the host is in Sx. The processor DRAM Controller is turned off and DRAM power stays in off/self refresh mode. There is no UMA usage in CM3 state. Less than 1MB of SRAM used for code and data. Code is executed off of flash takes ~1mS.
CM0-PG	Core Well Powered; Intel® ME Well Powered; (Intel® ME core not consuming power) DRAM available.
CM3-PG	An Intel® ME Firmware power state where no power is applied to the Management Engine subsystem. (Intel® ME firmware is shut down).
OS Hibernate	System state where the OS state is saved on the hard drive.
S0	A system state where power is applied to all HW devices and the system is running normally.
S1, S2, S3	A system state where the host CPU is halted but power remains available to the memory system (memory is in self-refresh mode).
S4	A system state where the host CPU and memory are not active.
S5	A system state where all power to the host system is off, however the power cord (and/or battery in mobile designs) is still connected.
Shut Down	Equivalent to the S5 state.
Snooze Mode	Intel® Management Engine activities are mostly suspended to save power. The Intel® Management Engine monitors HW activities and can restore its activities depending on the HW event.
Standby	System state where the OS state is saved in memory and resumed from the memory when mouse/keyboard is clicked.
Sx	All S states which are different than S0.

1.5 Reference Documents

Document	Doc Number/ Location*
<i>Cannon Lake Intel® Management Engine (Intel® ME) and Embedded Controller Interaction Product Specification Revision 0.5</i>	549024 / CDI
<i>Intel® Management Engine BIOS Writers Guide</i>	TBD / *
<i>Intel® Management Engine (Intel® ME) 11 SKU Firmware Corporate Compliance Guide for Cannon Lake PCH-H/LP Chipset Family - Cannon Lake Platform Compliancy and Testing Guide - Revision 1.1</i>	TBD / CDI

Note: * Unless specified otherwise, a document can be ordered by providing its reference number to your Intel Field Applications Engineer.

1.6 Format and Notation

The formats and notations used within this document model are those typically used by BIOS vendors. This section describes the formatting and the notations that will be followed in this document.

Table 1-1. Number Format Notation

Number Format	Notation	Example
Decimal (default)	d	14d. Note that any number without an explicit suffix can be assumed to be decimal.
Binary	b	1110b
Hex	h	0Eh
Hex	0x	0x0E

Table 1-2. Data Format Notation

Data Type	Notation	Size
Bit	b	Smallest unit, 0 or 1
Byte	B	8 bits
Word	W	16 bits or 2 bytes
Double-word	DW	32 bits or 4 bytes
Quad-word	QW	8 bytes or 4 words
Kilobyte	KB	1024 bytes
Megabit	Mb	1,048,576 bits or 128 KB
Megabyte	MB	1,048,576 bytes or 1024 KB
Gigabit	Gb	1,073,741,824 bits
Gigabyte	GB	1024 MB

1.7 Kit Contents

The Intel® ME Corporate FW kit can be downloaded from VIP (<https://platformsw.intel.com/>). The contents of this kit are detailed below (Note that only key files are listed).

1.8 External Hardware Requirements for Bring Up

Acquire the following hardware tools before moving on to the next step.

Windows* OS System	Flash Burner	DOS Bootable USB Key
		
<p>Equipment:</p> <ul style="list-style-type: none"> Laptop or desktop that supports win32 applications <p>Purpose:</p> <ul style="list-style-type: none"> Will run firmware image assembly and build process software. 	<p>Equipment:</p> <ul style="list-style-type: none"> (Optional) For platforms that don't boot, a Flash Chip Programmer will be required For platforms that can boot to DOS or Windows*, a Intel® FPT is provided in this kit <p>Purpose:</p> <ul style="list-style-type: none"> Will burn firmware images onto the target system Flash device(s). 	<p>Equipment:</p> <ul style="list-style-type: none"> A DOS Bootable USB Key (Size > 512 MB) <p>Purpose:</p> <ul style="list-style-type: none"> Acting as a bootable device and will be used to run Intel® FPT (fpt.exe) directly on the system that is undergoing Bring Up process. Or will be used to transfer a firmware image onto a Flash burner.

§ §

2 Image Creation: Intel® Flash Image Tool

Intel® Flash Image Tool (Intel® FIT) can be used to generate either a full SPI Flash binary image with Descriptor, GbE, BIOS, and Intel® ME Regions. Additionally, it can be used to create a simple image containing only the Intel® ME Region only for use with custom SPI Flash binary image assembly solutions. Use the steps shown in following sections.

After this image has been created, it will need to be burned onto the target platform's SPI Flash device(s). [Section 3, "Programming SPI Flash Devices and Checking Firmware Status"](#) later in this document provides steps to do this.

Note: The Flash Image Tool may be updated throughout the release cycles. As a general rule, please ensure you use the tools, images and other content from the same kit and refrain from using different version tools.

2.1 Start Intel® FIT

1. Invoke Intel® Flash Image Tool. Using Explorer*, navigate to **[root]\Tools\System Tools\Flash Image Tool**. Verify that the directory contents are correct (see [Section 1.7](#)). Double-click **FIT.exe**.
2. **NOTE:** In the tables below, where default settings are listed for CNL LP/H, if the value is the same one value will be listed. If there is a different default value when the program loads with either platform, both values will be listed to show the difference.

2.2 Step-by-Step Guide to Build SPI Flash Image with Intel® FIT Interface

Table 2-1. - Initial Screen Layout (Sheet 1 of 9)

#	Label	Contents
1	New	This button labeled 'New' on rollover allows opening of a new session with default values
2	Open	This button labeled 'Open' on rollover allows opening of an xml or bin file
3	Save	This button labeled 'Save' on rollover allows saving of xml file
4	Clear Console	This button labeled 'Clear Console' clears the console area (see page 23)
5	Build Settings	This button labeled 'Build Settings' brings up the build settings popup Window see (Table 2-2)
6	Build Image	This button labeled 'Build Image' on rollover allows build of the image

Table 2-1. - Initial Screen Layout (Sheet 2 of 9)

#	Label	Contents

	Build Version - This displays Build version number of the currently loaded Intel® ME binary.		
	Chipset Initialization Version - This displays the current Chipset Initialization version contained in the currently loaded Intel® ME binary.		

Table 2-3. - Flash Layout (Sheet 3 of 5)

	Chipset Initialization Binary - This loads the Chipset Initialization binary that will be merged into the output image generated by the Intel® FIT. If specified, this will override the version contained in the Intel® ME binary to align with the values programmed by BIOS. Note: When BIOS passes new Chipset Initialization settings to ME, a Global Reset is initiated (only required on the first boot, subsequent boots will not incur a global reset). This allows for the new settings to be stored in the ME Region and programmed into the PCH. This global reset can be avoided by loading the proper chipset initialization binary in to the ME Region when building the image that aligns with the values in BIOS. The Chipset Initialization Binary will be included in BIOS RC package. If BIOS contains an older version of Chipset Initialization settings ME will be updated at boot with the older settings regardless of any newer settings being present in firmware. In order to avoid this problem and the additional Global Reset customers should ensure that both BIOS and ME are updated with same Chipset Initialization binary.	CFL-S CFL-H	Chipset.bin (Optional) Chipset.bin (Optional)
	Chipset Init Override Version - This displays the version of the Chipset Initialization Binary override if specified.		
	PMC Binary File - This loads the PMC binary that will be merged into the output image generated by the Intel® FIT tool.	CFL-S CFL-H	PMC.bin PMC.bin
	Version - This displays the version of PMC

Table 2-4. - Flash Settings (Sheet 1 of 9)

Click on Flash Settings in the left tabs menu> Flash Components is expanded by default:			
<div> <div>▼ Flash Components</div> <div>1</div> </div>			
Parameter	Value		
Number of Flash Components	1	Specifies the number of Flash components	
Flash component 1 Size	16MB	This field identifies the size of the 1st Flash component	
Flash component 2 Size	8MB	This field identifies the size of the 2nd Flash component	
SPI Global Protected Range	0x0	Sets the default value of the Global Protected Range register in the SPI Flash Controller.	
SPI Idle to Deep Power Down Timeout Default	0x5	Specifies the time in microseconds that the Flash Controller waits after all activity is idle before commanding the flash devices to Deep Power down, time = 2^N microseconds.	
SPI Out of Order operation Enabled	Yes	When this setting is enabled priority operations may be issued while waiting for write / erase operations to complete on the flash device. When this setting is disabled all write / erase type operations in order.	
SPI Resume Hold-off Delay	4us	This specifies the time after the completion of a pri_op before the flash controller sends the resume instruction. If a new pri_op is eligible to be issued prior to the end of this delay time then the pri_op is issued and the timer is reinitialized to tRHD. 3-bit field encodes count with range 0-7. tRHD = count * 2us.	
SPI Max write / erase Resume to Suspend intervals	No Ceiling	This setting specifies the maximum value for the write and erase Resume to Suspend intervals.	
SPI Suspend / Resume Enabled	Yes	When this setting is enabled writes and erases are allowed while the flash is in suspend.	
SPI Software Binding Enabled	No	When enabled this settings will allow for SPI software binding.	
#	Parameter	Platform	Settings
1	Flash Components		
	Number of Components Values: 0, 1, 2 - This setting configures the total number of flash components for the platform. Note: Choosing a selection of '0' part will cause the Intel® FIT tool to build an output image containing only the Intel® ME region.	CFL-S CFL-H	1 1
	Flash component 1 Size Values: 512KB, 1MB, 2MB, 4MB, 8MB, 16MB, 32MB, 64MB - This setting determines the size of Flash component 1 for the platform image.	CFL-S CFL-H	32MB 32MB
	Flash component 2 Size Values: 512KB, 1MB, 2MB, 4MB, 8MB, 16MB, 32MB, 64MB - This setting determines the size of Flash component 2 for the platform image. Note: This setting is only applicable when the Number of Flash Components option is set to '2'.	CFL-S CFL-H	Greyed Out Greyed Out
	SPI Global Protected Range - This sets the default value of the Global Protected Range register in the SPI Flash Controller.	CFL-S CFL-H	0x0 0x0
	SPI Idle to Deep Power Down Timeout - This sets SPI Idle to Deep Power Down Timeout Default Specifies the time in microseconds that the Flash Controller waits after all activity is idle before commanding the flash devices to Deep Power down, time = 2^N microseconds.	CFL-S CFL-H	0x5 0x5
	SPI Out of Order operation Enabled - When this setting is enabled priority operations may be issued while waiting for write / erase operations to complete on the flash device. When this setting is disabled all write / erase type operations in order.	CFL-S CFL-H	Yes Yes
	SPI Resume Hold-off Delay - This specifies the time after the completion of a pri_op before the flash controller sends the resume instruction. If a new pri_op is eligible to be issued prior to the end of this delay time then the pri_op is issued and the timer is reinitialized to tRHD. 3-bit field encodes count with range 0-7. tRHD = count * 2us.	CFL-S CFL-H	4us 4us
	SPI Max write / erase Resume to Suspend intervals - This setting specifies the maximum value for the write and erase Resume to Suspend intervals.	CFL-S CFL-H	No Ceiling No Ceiling

Table 2-4. - Flash Settings (Sheet 2 of 9)

	SPI Suspend / Resume Enabled - When this setting is enabled writes and erases may be suspended to allow a read to be issued on the flash device. When this setting is disabled no transaction will be allowed to the busy flash device.	CFL-S CFL-H	Yes Yes
	SPI Software Binding Enabled - When enabled this settings will allow for SPI re-binding to a new PCH during re-manufacturing flows.	CFL-S CFL-H	No No

Profile Changeable	true	Allows user to change boot profile via BIOS menu or 3rd party appli...	
#	Parameter	Platform	Settings
1	Integrated Clock Controller - Integrated Clock Controller Policies		
	Boot Profile This parameter allows user to select default profile to be used by the final generated SPI Flash binary image for the target platform at boot time. Selection is limited to the profiles defined under "Integrated Clock Controller Profiles "up to maximum 16 profiles. Profiles can be added by clicking on "Add profile" button under "Integrated Clock Controller Profiles". The 'Record #' refers to profile created under the "Integrated Clock Controller Profiles". Default boot profile for system is Profile 0. Double click on value column of this parameter to choose from available options.	CFL-S CFL-H	Profile 0 Profile 0
	Failsafe Profile This parameter specifies the profile index of the fail-safe profile. On boot failure detection or CMOS clear the Intel® ME Firmware will revert to this profile if "Integrated Clock Controller Integrated Clock Controller Policies - Profile Changeable " is set to True. If profile Changeable parameter is set to False, User can not select Failsafe Boot Profile and profile 0 will be selected as a fail safe boot profile by default. The 'Record #' refers to profile created under the "Integrated Clock Controller Profiles". Default Failsafe boot profile for system is Profile 0. Double click on value column of this parameter to choose from available options.	CFL-S CFL-H	Profile 0 Profile 0
	Profile Changeable Possible configuration: True/False. This parameter controls if BIOS or 3rd party application can select boot profile or not. When set to true, it allows user to change boot profile via BIOS or 3rd party application. When set to false, Runtime change to boot profile is not allowed and boot profile selected by "Integrated Clock Controller Integrated Clock Controller Policies - Boot Profile " parameter will be used to boot platform. Double click on value column of this parameter to choose from available options.	CFL-S CFL-H	True True
Click on Integrated Clock Controller in the left tabs menu> Profiles are expanded by default:

<div> <div>Profile 0</div> <div>3</div> <div>+ Add Profile</div> </div>			
▼ Profile 2			
Parameter	Value	Help Text	
Profile Name	Profile 0	Editable text string.	
Profile Type	Standard	Specifies the profile. Intel (R) ME image has to be loaded to enable other ICC profile settings.	
#	Parameter	Platform	Settings
2	Integrated Clock Controller - Profiles - Profile 0 Note: Intel® ME image has to be loaded to enable other ICC profile settings. For CNL/CFL-S/H, Intel® FIT provides 2 pre- defined ICC profiles to choose from. •Standard: This profile provides default settings for standard configuration, no adaptive clocking is allowed. Platform clocks output internal and external are driven from USB3PCIe clock. Default clock frequency is 100 MHz with 0.47%DownSpread. BCLK clock source should be turned off in this case to save power. •Adaptive: This profile provides Wimax/3G friendly configuration. This profile will configure the platform based on the Adaptive profile allowing adaptive clocking adjustment for BCLK clock source to reduce EMI interference. It supports default clock frequency of 98.875 MHz with 0.48% Downspread. For CNL/CFL-S/H, Intel® FIT provides 5 pre-defined ICC profiles to choose from. •Standard •Adaptive Note: User can select pre-defined profiles via "Integrated Clock Controller Profiles - Profile Type " parameter User can add up to maximum 16 profiles.To add new profile, please use "Integrated Clock Controller Profiles - + Add Profile Button"	CFL-S CFL-H	Standard Standard
	Profile Name This parameter allows user to customize profile name for easy identification. By default it uses pre-defined profile name like Profile 0.	CFL-S CFL-H	Profile 0 Profile 0
	Profile Type Available ICC profiles for CNL/CFL-S/H are Standard, Adaptive. This parameter indicates which pre- defined profile selected for each profile#. Double click on value column of this parameter to choose from available options.	CFL-S CFL-H	Standard Standard
3	+ Add Profile Button This button is used to add new ICC profile. User can add up to maximum 16 profiles. New profile will be added under "Integrated Clock Controller Profiles" tab.	CFL-S CFL-H

Table 2-15. - Flex I/O Straps (Sheet 9 of 12)

#	Parameter	Platform	Settings
5	Flex I/O - USB3 Port Configuration Note: USB Type-C Mux Control: On Cannon / Coffee Lake PCH, device mode is supported on all USB3.1 Type-C ports. EC/PD/PC needs to send a OOB command to the PCH to properly map the USB 2.0 and USB 3.1 signals to the Host controller or Device mode controller when a connection is detected on the Type-C port. Without these OOB message, the USB2.0/3.1 signals may not be correctly mapped and the USB functionality may be impacted. For more detail, see Cannon Lake and Coffee Lake Platform USB Type-C Mux Control Over eSPI doc # 570737.		
	USB3 / PCIe Combo Port 0 Values: USB3, PCIe This setting configures the PCIe port to operate as either: PCIe Port 1 or USB3 Port 1 For further details on Flex I/O see Cannon Lake H Platform Controller Hub EDS. Note: If DCI BSSB for this USB3 Combo port it will be Grayed out.	CFL-S CFL-H	USB3 USB3
	USB3 / PCIe Combo Port 1 Values: USB3, PCIe This setting configures the PCIe port to operate as either: PCIe Port 2 or USB3 Port 2 For further details on Flex I/O see Cannon Lake H Platform Controller Hub EDS. Note: If DCI BSSB for this USB3 Combo port it will be Grayed out.	CFL-S CFL-H	USB3 USB3
	USB3 / PCIe Combo Port 2 Values: USB3, PCIe This setting configures the PCIe port to operate as either: PCIe Port 3 or USB3 Port 3 For further details on Flex I/O see Cannon Lake H Platform Controller Hub EDS. Note: If DCI BSSB for this USB3 Combo port it will be Grayed out.	CFL-S CFL-H	PCIe USB3
	USB3 / PCIe Combo Port 3 Values: USB3, PCIe This setting configures the PCIe port to operate as either: PCIe 4 or USB3 Port 4 For further details on Flex I/O see Cannon Lake H Platform Controller Hub EDS. Note: If DCI BSSB for this USB3 Combo port it will be Grayed out.	CFL-S CFL-H	USB3 USB3
	USB3 Port 1 Connector Type Select Values: Type C, Micro AB, Type A, Type B, Express Card / M.2 S2 This setting configures the physical connector type to be used for USB 3.1 Port 1.	CFL-S CFL-H	Type A Type A
	USB3 Port 2 Connector Type Select Values: Type C, Micro AB, Type A, Type B, Express Card / M.2 S2 This setting configures the physical connector type to be used for USB 3.1 Port 2.	CFL-S CFL-H	Type A Type A

2	Console shows status of build and path where saved		

3 Programming SPI Flash Devices and Checking Firmware Status

Now that the Flash image file has been created, it can be programmed into the SPI Flash device(s) of the target machine. For platforms that don't boot, a Flash Chip Programmer will be required. For platforms that can boot to DOS or Windows*, the Intel® FPT can be used.

3.1 Flash Burner/Programmer

The specific use of a Flash burner/programmer is beyond the scope of this document. Here are some general steps that may be followed:

1. Navigate to your **Output Directory** (as specified in Table 2.2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**.

If two total SPI Flash devices were specified during the build process, then additional image files will be saved, one for each SPI Flash device. These files are assumed to be named **outimage(1).bin** and **outimage(2).bin**.

2. Utilize a Flash burner/programmer to program the image(s). For multiple SPI Flash devices, the images are numbered sequentially to correspond to the first and second SPI Flash device accordingly.

3.1.1 In-Circuit SPI Flash Programming for CRB

Mobile CRBs have the SPI Flash devices soldered down. As a result, to program the SPI Flash for mobile CRBs, follow these steps:

1. Leave CRB powered on.
2. Connect Flash Programmer (such as DediProg SF600) header to connector **J3F3** which is labelled "**SPI TPM**". Make sure to line up pin 1 on the header.
3. Program the first image [outimage(1).bin] to the CRB.
4. In Dediprog software, select application memory chip 2 button and load second image if created.
5. Program the second image [outimage(2).bin] to the CRB if created.
6. Once programming is complete, disconnect the Flash Programmer header. Power off and unplug CRB. Remove cell coin battery, wait approximately 10 seconds. Replace cell coin battery, plug CRB back in and power on.

3.2 Flash Programming Tool (Intel® FPT)

Intel® FPT can be used to substitute for a Flash burner/programmer, provided the system is capable of booting to a DOS or Windows* OS.

Note: Intel® FPT will automatically disable the Intel® ME or EFI prior to flashing the image to the platform.

Intel® FPT DOS Version

The DOS versions supported by Intel® FPT are: DOS, Free DOS, and DRMK DOS. Use the following steps to program the SPI Flash devices,

1. Copy all the files in the “(root)\Tools\System Tools\Flash Programming Tool\DOS” directory to the root directory of a bootable USB key.
2. Navigate to your **Output Directory** (as specified in Table 2.2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to the root directory of the USB key.
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
fpt.exe -i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

4. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fpt.exe -f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

5. Execute a platform global reset using Intel® FPT -greset. Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

3.2.1 Intel® FPT Windows* Version

The Windows* OS versions supported by Intel® FPT are: Windows* PE 64, Windows* 7, Windows* 8/8.1. There are two versions of Intel® FPT for Windows*: a 32-bit version and a 64-bit version. Most Windows* OS, Windows* 7 (32-bit or 64-bit), Windows* 8/8.1 (32-bit or 64-bit) can use Windows* version of Intel® FPT. However, Windows* OS which do not support 32 bit compatible mode (Win PE 64-bit) **must use** Intel® FPT Windows* 64-bit version due to compatibility issues.

Use the following steps to program the SPI Flash devices,

1. Navigate to your **Output Directory** (as specified in [Table 2.2](#)) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to Intel® FPT directory located at "(root)\Tools\System Tools\Flash Programming Tool\Windows".
2. Boot the target system to Windows* and open a Command Prompt window. In this window, change to the Intel® FPT directory and at the prompt type:

```
fptw.exe -i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

3. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fptw.exe -f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

4. Use fptw.exe -greset to perform a G3 power cycle. Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

3.3 Checking Intel® ME Firmware Status

Use the following steps to check the platform health and Intel® ME FW status,

1. Copy the file **MEInfo.exe** in the "(root)\Tools\System Tools\MEInfo\DOS" directory to the root directory of a bootable USB key.
2. Boot the target system and use F2 or Del to enter the BIOS setup menu. Load default values for BIOS (on Intel® CRBs press F3 to load default values). Save and reboot (on Intel® CRBs press F4 and select Yes).
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
MEInfo.exe -fwsts
```

The system should respond with a message similar to below.

```
Intel® MEInfo Version: 12.0.0.xxxx

Copyright(C) 2005 - 2014, Intel Corporation. All rights reserved.

FW Status Register1: 0x1E000255
FW Status Register2: 0x60002306
FW Status Register3: 0x00000300
FW Status Register4: 0x00004001
FW Status Register5: 0x00000101
FW Status Register6: 0x03C00FC9

Current State: Normal
ManufacturingMode: Enabled
FlashPartition: Valid
OperationalState: M0 with UMA
InitComplete: Complete
BUPLoadState: Success
ErrorCode: No Error
ModeOfOperation: Normal
Phase: HOSTCOMM Module
ICC: Valid OEM data, ICC programmed
SPI Flash Log: Not Present
ME File System Corrupted: No
FPF and ME Config Status: Not committed
```

As in the above example if there are NO errors shown, then

- your platform's health is good
- Intel® ME FW has successfully initialized
- Intel® ME FW is operating normally

Note: This section is only intended to show how to use the MEInfo.exe tool for checking firmware status. For full usage and capabilities of the MEInfo.exe tool, please see the System Tools User Guide.

3.4 Common Bring Up Issues and Troubleshooting Table

Table 3-1. Common Bring Up Issues and Troubleshooting Table

Problem / Issue	Solution / Workaround
System does not boot to DOS	By default, the system will boot to EFI Shell. To boot to DOS, <ol style="list-style-type: none"> 1. Enter BIOS menu, then go to the 'Boot' screen 2. Change 'Boot Option #1' to be your USB key (ensure USB key is formatted to be DOS bootable) 3. Press 'F4' to save settings and reboot
Hear 3 beeps when platform powers on	Possible device is disconnected or device not found, check <ul style="list-style-type: none"> • platform power and MCP fan power connectors • DIMM memory modules (if applicable for memory down modules) • USB devices (keyboard, mouse, USB key) may be plugged into inactive USB port • missing/incorrect jumpers • missing or poorly socketed MCP
No display on monitor	Ensure Corporate FW SKU supports integrated graphics. Try external graphics card.
USB device not detected or does not work	USB device may be plugged into inactive USB port
System does not boot (Post Code 00)	Incorrect Flash image – possible reasons: <ul style="list-style-type: none"> • wrong FW selected during Flash image build process • wrong Flash size selected Re-build image with correct settings and re-flash using Flash burner.

§ §

A Appendix — Flash Configurations

This chapter covers only the basic information needed for clock control parameter programming. For a more detailed treatment of Mainstream - Mobile Family clocks, see Intel® Cannon Lake PCH-H / LP Clocks and Intel® Management Engine — Platform Compliancy Guide for ME Hardware.

Figure A-1. Configuration “A” — Desktop/Server/Workstation or Mobile

Figure A-2. Configuration “B” — Mobile Only

Figure A-3. Configuration “C” — Desktop/Server/Workstation Only

Figure A-4. Configuration “D” — Mobile Only

§ §

B Appendix — Intel® ICCS SKU Support Matrix

The following table describes ICC features supported for specific PCH SKU, clock range (maximum and minimum), spread mode supported by Cannon Lake-H SKUs.

Note: Please refer to Cannon Lake-H/LP Platform Controller Hub (PCH) External Design Specification (EDS) for details about Cannon Lake-H/LP Chipset Clock architecture

In below tables,

Min = Clock Div Max (minimum allowed frequency)

Max = Clock Div Min (maximum allowed frequency)

B.1 Intel® ICCS SKU Matrix - CNP-H

Note: ICC SKU is divided into 2 categories: Basic and Enhanced. Mark "x" indicates category supported by PCH SKU.

Table B-1. Intel® ICCS SKU Matrix - CNP-H

PCH SKU	Basic	Enhanced
Canonpoint H		x
Features Supported	Standard Clock Configuration	Standard Clock Configuration Adaptive Clock Configuration
Pre-Defined ICC profile supported	Standard	Standard Adaptive
Clock Range Supported	[Min-Max] = 100 MHz.	BCLK [Min-Max] = 98 - 100 MHz.
SSC Supported	Down SSC: 0 - 0.5%	Down SSC: 0 - 0.5%

B.2 How to configure CLKREQ# parameters

Below table provides guideline on how to configure CLKREQ# parameters for SRC[0:15] output clocks depending on dynamic control of the clock via CLKREQ is required or not.

Configuring CLKREQ# and assigning GPIO depends on how CLKOUT_SRCx configuration via FIT is done (Enabled or Disabled) and if CLKREQ is required or not.

Note: In below table, Mask Control CLKREQ cannot be configured via FIT Tool. It's configured to default once by FW during cold boot and bios can set/clear bits anytime.

C Appendix — Boot Guard Configuration

C.1 Boot Guard Profiles

The following table describes the profiles available for Boot Guard Configuration.

Table C-1. Profile Description

Index	Profile Name	F	V	M	ENF	PBE	Description
0	Boot Guard Profile - No_FVME	0	0	0	00	0	This configuration will invoke Boot Guard during boot with neither Verification nor Measurement. For platforms with all the required Boot Guard components but do not wish to enable Boot Guard boot block verification protection.
1	Boot Guard VE	0	1	0	01	1	When Verification is desired but if verification fails the platform will continue to boot with the unverified IBB for a short period, to allow remediation.
2	Boot Guard VME	0	1	1	01	1	When Verification and Measured are desired and the asset protection is provided by both TPM protection and a timed remediation period.
3	Boot Guard VM	0	1	1	00	1	When Verification and Measured are desired and the asset protection is provided by TPM protection.
4	Boot Guard FVE	1	1	0	11	1	Strict Verification enforcement.
5	Boot Guard FVME	1	1	1	11	1	Strict Verification and Measured enforcement. Prevents unverified IBB from running.

C.2 Enforcement Policies

Table C-2. Enforcement Policy Description

Error Enforcement Policy (ENF)	Enforcement Mode Name	Description
0	Unrestricted Mode	Infinite time before shutdown – don't shutdown the platform, let everything run normally.
1	Remediation Mode	30 minutes before shutdown – enough time to remediate the system, e.g. update BIOS or other data on flash via host tools.
2	Reserved	
3	Restricted Mode	0 minutes before shutdown – instant shutdown policy.

C.3 OEM Profile Parameters

Table C-3. Profile Parameters Description

Parameter	Description	Settings
Force Boot Guard ACM Enabled (F)	Force Boot Guard Boot determines if the platform starts the Force Boot Guard Boot timer. If it successfully starts it indicates success. When the Force Boot Guard timer stops, it starts the Protect Bios Environment timer, if indicated by the boot policy restrictions. Anchor ACM then jumps to the Initial Boot Block (IBB) with the Force Boot Guard Boot time stopped and the Protect BIOS enable timer running.	false - Allow the CPU to jump to the legacy reset vector if the Boot Guard Module cannot be successfully loaded. (default) true - Force the Boot Guard ACM to execute.
Verified Boot Enabled (V)	Boot Guard cryptographically verifies the platform Initial Boot Block (IBB) using the boot policy key. On successful verification, Boot Guard executes Initial Boot Block (IBB) using the boot policy key. If the verification fails, Anchor signals or enters Remediation.	false - Platform does not perform verified boot (default) true - Platform performs verified boot
Measured Boot Enabled (M)	Boot Guard measures the Initial Boot Block (IBB) into the TPM. Boot Guard perform no verification that the IBB is correct or from the platform manufacturer. The Skylake implementation of Boot Guard will support measurements into TPM or Intel's Platform Trust Technology.	false - Platform does not perform measured boot (default) true - Platform performs measured boot
Protect Bios Environment Enabled (PBE)	Platform manufacturer may want Initial boot block to be protected between verification/ measurement and execution from attacks on buses and non-CPU components. Boot Guard accomplishes this by allowing the initial boot block to be verified and executed in LLC in NEM if PBE is enabled.	false - Take no actions to control the environment during execution of the BIOS components (default) true - Takes actions to control the environment during the execution of the BIOS components.
Error Enforcement Policy (ENF)	Boot Guard invokes the Enforcement Policy when a fatal error is encountered. The action taken by ENF is determined by the OEM set persistent policies. Like, <ul style="list-style-type: none"> Allowing platform to continue to boot Immediate Shutdown Shutdown with Timeout intervals When the ENF logic is invoked, PTT or TPM also disconnects.	See Section C-2 for details.

D Appendix — Intel® Platform Trust Technology

D.1 Intel® Platform Trust Technology

The following table describes the platform configurations supported by Intel® Platform Trust Technology.

Note: Intel® Platform Trust Technology does not support the full TPM functionality requirements and should not be used for Intel® vPro™ based platforms.

Table D-1. Intel® Platform Trust Technology Configuration table

Configuration	Platform Protection> Intel® PTT Configuration Intel® PTT Initial power up state	Platform Protection> Intel® PTT Configuration Intel® PTT Supported	Platform Protection> Intel® PTT Configuration Intel® PTT Supported [FPF]	Description
Intel® PTT Permanently Disabled in HW via FPF	Disabled	No	No	After the End of Manufacturing command, this setting will permanently set into the FPFs contained in the MCP. If disabled, the specific MCP can never be enabled for Intel® PTT.
Intel® PTT Permanently Disabled in base firmware image	Disabled	No	Yes	This setting allows Intel® PTT to be set to disabled without disabling the MCP FPFs. This is the recommended option to permanently disable Intel® PTT on a platform.
Intel® PTT Ship State Disabled in base firmware image	Disabled	Yes	Yes	Intel® PTT initially shipped in disabled mode, can be enabled by BIOS command.
Intel® PTT Enabled	Enabled	Yes	Yes	This is the recommended option to enable Intel® PTT on a platform.

E Appendix — Integrated Sensor Hub (ISH) Public Key Settings

The following table describes the configuration matrix required for ISH configuration for the Intel® FIT tool. Please see System Tools User Guide within ME kit, Manufacturing Test with Intel® Management Engine (Intel® ME) Firmware 12 and Intel® Integrated Sensor Solution on Cannon Lake Mobile, Cannon Lake Desktop, (CDI # WIP) for additional details.

CLSMNF = Close Manufacturing switch used with Intel® Flash Programming Tool (FPT)

PV = Production Version

For additional information on FPT see System Tools User Guide included with ME kit under system tools folder.

Table E-1. ISH Public Key Settings

Firmware	MCP	FPF Automatic Commit	FPF MEI command after CLSMNF (Yes/No)	FPF MEI command before CLSMNF (Yes/No)
Pre-production	Production	No	No - Not a valid combination	No - Not a valid combination
Production (PV not set)	Pre-production	No	Yes	No
Production (PV not set)	Production	No	Yes	No
Pre-production	Pre-production	No	Yes	No
Production (PV not set)	Production	Yes	No	No

Note: The Intel® FIT allows integration of binary files within Integrated Sensor Hub section under ISH Image and ISH Data. The Intel® FIT does not generate or create the required files. The table above lists configuration combinations that can be used.
